## **What Warming?: Satellite view of global temperature change** Arno Arrak

This book questions the existence of anthropogenic global warming (AGW) and exposes errors of global warming advocates. It uses satellite global temperature measurements to show that the "late twentieth century warming" simply did not exist. What satellites do see in the eighties and nineties is that global temperature simply oscillated around a median value by half a degree Celsius, in synch with the El Nino-Southern Oscillation stages. Real warming began with the 1998 super El Nino but that did not last and was not caused by carbon dioxide greenhouse effect either. In 2007 we got some serious cooling while climate models using carbon dioxide theory insisted on relentless warming at the same time. If a theory predicts warming and we get cooling that theory as a scientific theory has failed and must be abandoned. Since the Kyoto Protocol and the proposed Copenhagen Treaty depend on the correctness that theory to tell us what temperatures to expect and since that theory has been proven to be incapable of doing that both treaties must be abandoned. There is no scientific justification for them and the only thing that supports them is propaganda from the climate activist movement.
